

SME Program - Next Course

Ontogenetic Development

May 4 - 8 2022

With Gloria Desideri, Marcella Fanzaga, Nisha Kewalramani

The time from conception to about 12 months of age is extraordinarily intense for the development of human beings. Our basic evolutionary patterns originate as early as in utero, are present at the time of birth, and develop over the first year of life.

It is during this time that we bring together the basic and foundational elements of our movement, develop our perceptual skills, and go through the milestones that mark our evolutionary journey.

This course includes the exploration of some of the stages of embryological development; fetal movement; the phases of breastfeeding, head control, hand-eye coordination; and those in which the skills of rolling, crawling on the belly, crawling, sitting, kneeling, all the steps up to standing, are developed.

We then learn how to recognize less efficient movement patterns that prevent the development of better integrated skills.

At CasaNave Alle Mura Tuscania.
